Accession Number: 6034676

Abstract:

Locating and retrieving specific data from the World Wide Web (WWW) is an important problem. Existing search engines often return too much useless data and are generally incapable of automatically extracting specific information such as names and email addresses. We describe WIRE, a WWW-based information retrieval and extraction system whose goal is to accurately retrieve and organize specific information from the World Wide Web. WIRE employs several innovative techniques. First, queries of WIRE are tree structured. This not only provides an order in which Web pages are to be searched/retrieved but also provides a context for more accurate retrieval. Second, WIRE employs a library of search templates based on the structure of HTML files to extract specific information. These templates can be complemented by user-provided search examples and patterns for better results. Third, WIRE has a filter mechanism to filter out undesired information to further improve retrieval accuracy.

Subject Terms:

Internet; WIRE; information extraction system; information retrieval system; World Wide Web; search engines; email; tree structured queries; Web pages; search templates; HTML files; user-provided search examples; information filtering

Gene Alert-a sequence search results keyword parser

- Huang, H.; Garner, H.R.

Texas Univ. Southwestern Medical Center, TX, USA

This Paper Appears in :

IEEE Engineering in Medicine and Biology Magazine

on Pages: 119 - 122

March-April 1998

Vol. 17

Issue: 2

ISSN: 0739-5175

References Cited: 0

CODEN: IEMBDE

Accession Number: 5896086

Abstract:

Similarity searching is an important tool to many biological scientists. Various computer implementations (BLAST, FASTA, Smith-Waterman) are used by scientists to analyze their sequences of interest to identify identities (perfect matches) or similarities (statistically significant matches) between their query sequences and large databases such as GenBank. Search engines currently return brief annotations and alignments ranked in order of statistical significance or raw similarity score. However, it is frequently not the top-scoring similarities that bring important new information to the investigating scientist, but the content of the annotation or similarity "hits" at any significant score. The Gene Alert algorithm applies additional filtering and a user weighted keyword search to the BLAST output to parse the output into a form customized to the user. There are three components to the Gene Alert implementation as it is currently operating: an organized file structure, a BLAST engine, and a parser written in the PERL scripting language. The file structure was designed to place code and database components in logical positions and to facilitate future complete automation of the Gene Alert and similarity search system. Shown here is the file structure within the UNIX environment.

Subject Terms:

genetics; sequence search results keyword parser; Gene Alert; BLAST;
organized file structure; PERL scripting language; database components;
similarity search system; UNIX environment; logical positions; significant
score; annotation; similarity score

Ontology based personalized search

- Pretschner, A.; Gauch, S.

Inst. fur Inf., Tech. Univ. Munchen, Germany

This Paper Appears in :

Tools with Artificial Intelligence, 1999. Proceedings. 11th IEEE International Conference on

on Pages: 391 - 398

This Conference was Held : 9-11 Nov. 1999

1999

ISBN: 0-7695-0456-6

Total Pages: xvii+446

References Cited: 30

Accession Number: 6442068

Abstract:

With the exponentially growing amount of information available on the Internet, the task of retrieving documents of interest has become increasingly difficult. Search engines usually return more than 1,500 results per query, yet out of the top twenty results, only one half turn out to be relevant to the user. One reason for this is that Web queries are in general very short and give an incomplete specification of individual users' information needs. This paper explores ways of incorporating users' interests into the search process to improve the results. The user profiles are structured as a concept hierarchy of 4,400 nodes. These are populated by 'watching over a user's shoulder' while he is surfing. No explicit feedback is necessary. The profiles are shown to converge and to reflect the actual interests quite well. One possible deployment of the profiles is investigated: re-ranking and filtering search results. Increases in performance are moderate but noticeable and show that fully automatic creation of large hierarchical user profiles is possible.

Subject Terms:

information needs; Internet; Web queries; users' information needs; search process; search results; retrieving documents; ontology based; personalized search; user profiles
